Chapter 27 Electric Charge and Coulomb's Law

Electromagnetism – A Preview
Electric Charge
Conductors and Insulators
Coulomb's Law
Charge Is Quantized
Charge Is Conserved

Chapter 28 The Electric Field

Fields
The Electric Field E
The Electric Field of Point Charges
Lines of Force
The Electric Fields of Continuous Charge Distribution
A Point Charge in an Electric Field
A Dipole in an Electric Field

Chapter 29 Gauss' Law

The Flux of a Vector Field
The Flux of the Electric Field
Gauss' Law
A Charged Isolated Conductor
Application of the Gauss' Law
Experimental Test of Gauss' Law and Coulomb's Law
The Nuclear Model of the Atom (Optional)

Chapter 30 Electric Potential

Electrostatic and Gravitational Forces
Electric Potential Energy
Electric Potential
Calculating the Potential From the Field
Potential Due to a Point Charge
Potential Due to a Collection of Point Charges
The Electric Potential of Continuous Charge Distributions
Equipotential Surfaces
Calculating the Field From the Potential
An Isolated Conductor
The Electrostatic Accelerator (Optional)

Chapter 31 Capacitors and Dielectrics

Capacitance
Calculating the Capacitance

Capacitors in Series and Parallel
Energy Stored in an Electric Field
Capacitors with Dielectric
Dielectrics: An Atomic View
Dielectrics and Gauss' Law

Chapter 32 Current and Resistance

Electric Current
Current Density
Resistance, Resistivity, and Conductivity
Ohm's Law
Ohm's Law: A Microscopic View
Energy Transfer in an Electric Circuit
Semiconductors (Optional)
Superconductors (Optional)

Chapter 32 DC Circuits

Electromotive Force
Calculating the Current in a Single Loop
Potential Difference
Resistors in Series and Parallel
Multiloop Circuits
Measuring Instruments
RC Circuits

Chapter 34 The Magnetic Field

The Magnetic Field B
The Magnetic Force on a Moving Charge
Circulating Charges
The Hall Effect
The Magnetic Force on a Current
Torque on a Current Loop
The Magnetic Dipole

Chapter 35 Ampère's Law

The Biot-Savart Law
Applications of the Biot-Savart Law
Lines of B
Two Parallel Conductors
Ampère's Law
Solenoids and Toroids
Electromagnetism and Frames of Reference (Optional)

Chapter 36 Faraday's Law of Induction

Faraday's Experiments
Lenz' Law
Motional emf
Induced Electric Fields
The Betatron
Induction and Relative Motion (Optional)

Chapter 37 Magnetic Properties of the Matter

Gauss' Law for Magnetism
Atomic and Nuclear Magnetism
Magnetization
Magnetic Materials
The Magnetism of the Planets (Optional)

Chapter 38 Inductance

Inductance
Calculating the Inductance
LR Circuits
Energy Storage in a Magnetic Field
Electromagnetic Oscillations: Qualitative
Electromagnetic Oscillations: Quantitative
Damped and Forced Oscillations

Chapter 39 Alternating Current Circuits

Alternating Circuits
Three Separate Elements
The Single-Loop RLC Circuit
Power in AC Circuits
The Transformer (Optional)

Chapter 40 Maxwell Equations

The Basic Equations of Electromagnetism
Induced Magnetic Fields and the Displacement Current
Maxwell's Equations
Maxwell's Equations and Cavity Oscillations (Optional)

Chapter 41 Electromagnetic Waves

The Electromagnetic Spectrum
Generating an Electromagnetic Wave
Traveling Waves and Maxwell's Equations
Energy Transport and the Poynting Vector
Momentum and Pressure of Radiation (Optional)

Chapter 42 The Nature and Propagation of Light

Visible Light
The Speed of Light
The Doppler Effect for Light
Derivation of the Relativistic Doppler Effect (Optional)

Consequences of the Relativistic Doppler Effect (Optional)

Chapter 43 Reflection and Refraction at Plane Surfaces

Geometrical Optics and Wave Optics
Reflection and Refraction
Deriving the Law of Reflection
Image Formation by Plane Mirrors
Deriving the Law of Refraction
Total Internal Reflection

Chapter 44 Spherical Mirrors and Lenses

Spherical Mirrors
Spherical Refracting Surfaces
Thin Lenses
Compound Optical Systems
Optical Instruments

Chapter 45 Interference

Double-Slit Interference
Coherence
Intensity in Double-Slit Interference
Interference from Thin Films
Optical Reversibility and Phase Changes on Reflection (Optional)
Michelson's Interferometer
Michelson's Interferometer and Light Propagation (Optional)

Chapter 46 Diffraction

Diffraction and the Wave Theory of Light
Single-Slit Diffraction
Intensity in Single-Slit Diffraction
Diffraction at a Circular Aperture
Double-Slit Interference and Diffraction Combined

Chapter 47 Gratings and Spectra

Multiple Slits
Diffraction Gratings
Dispersion and Resolving Power
X-Ray Diffraction
Holography (Optional)

Chapter 48 Polarization

Polarization
Polarizing Sheets
Polarization by Reflection
Double Refraction
Circular Polarization
Scattering of Light

To the Quantum Limit

Chapter 49 Light and Quantum Physics

Thermal Radiation
 Planck's Radiation Law
 The Quantization of Energy
 The Heat Capacity of Solids
 The Photoelectric Effect
 Einstein's Photon Theory
 The Compton Effect
 Line Spectra

Chapter 50 The Wave Nature of Matter

The Wave Behavior of Particles
 The De Broglie Wavelength
 Testing De Broglie's Hypothesis
 Waves, Wave Packets, and Particles
 Heisenberg's Uncertainty Relationships
 The Wave Function
 Trapped Particles and Probability Densities
 Barrier Tunneling
 The Correspondence Principle
 Waves and Particles

Chapter 51 The Structure of Atomic Hydrogen

The Bohr Theory
 The Hydrogen Atom and Schrödinger's Equation
 Angular Momentum
 The Stern-Gerlach Experiment
 The Spinning Electron
 Counting the Hydrogen Atom States
 The Ground State of Hydrogen
 The Excited States of Hydrogen
 Details of Atomic Structure (Optional)

Chapter 52 Atomic Physics

The X-Ray Spectrum
 X Rays and the Numbering of the Elements
 Building Atoms
 The Periodic Table
 Lasers and Laser Light
 Einstein and the Laser
 How a Laser Works
 Molecular Structure

Chapter 53 Electrical Conduction in Solids

Conduction Electrons in a Metal
 Filling the Allowed States
 Electrical Conduction in Metals
 Bands and Gaps

Conductors, Insulators, and Semiconductors
 Doped Semiconductors
 The *pn* Junction
 Optical Electronics
 The Transistor
 Superconductors

Chapter 54 Nuclear Physics

Discovering the Nucleus
 Some Nuclear Properties
 Radioactive Decay
 Alpha Decay
 Beta Decay
 Measuring ionizing Radiation
 Natural Radioactivity
 Nuclear Reactions
 Nuclear Models (Optional)

Chapter 55 Energy from the Nucleus

The Atom and the Nucleus
 Theory of Nuclear Fission
 Nuclear Reactors: The Basic Principles
 A Natural Reactor
 Thermonuclear Fusion: The Basic Process
 Thermonuclear Fusion in Stars
 Controlled Thermonuclear Fusion
 Magnetic Confinement
 Inertial Confinement

Chapter 56 Particle Physics and Cosmology

Particle Interactions
 Families of Particles
 Conservation Laws
 The Quark Model
 The Big Bang Model
 Nucleosynthesis
 The Age of the Universe

Appendices

A The International System of Units (SI)
 B Some Fundamental Constants of Physics
 C Some Astronomical Data
 D Properties of the Elements
 E Periodic Table of the Elements
 F Elementary Particles
 G Conversion Factors
 H Mathematical Formulas
 I Computer Programs
 J Nobel Prizes in Physics

The Classical Electromagnetic Field, Leonard Eyges, Dover Publications, Inc., New York, 1972

Chapter 1 Concepts of a Field Theory

Chapter 2 The Electrostatic Field

The distribution of charge
 Coulomb's law and superposition
 The electric field
 The potential

Chapter 3 The Summation Problem for Charges

Point charge on z-axis
 Axial multipole expansion
 General multipole expansion
 Two-dimensional distributions
 One-dimensional distributions
 Surface charges and double layers
 Dipole distributions—exterior fields
 Dipole distributions—interior fields

Chapter 4 Boundary Value Problems with Conductors

The physics of conductors in fields
 Homogeneous and inhomogeneous problems
 A uniqueness theorem
 Method of images
 Laplace's equation and superposition of elementary solutions
 Composite problems
 Integral equations

Chapter 5 General Boundary Value Problems

Dirichlet and Neuman problems
 Superposition of elementary solutions
 Green's theorem and an integral identity for the potential
 A generalized integral identity and Green functions
 Application of Green functions
 General properties of Green functions

Chapter 6 Dielectrics

Introduction
 Polarization charge and the average internal field
 The relation of polarization to the applied field
 Capacitors and the dielectric constant
 Boundary value problems with dielectrics
 Macroscopic and microscopic properties

Chapter 7 The Magnetostatic Field

Current and related concepts
 Forces between conductors and the magnetostatic field *B*

Differential and integral properties of *B*
 The magnetic scalar potential
 The vector potential

Chapter 8 The Summation Problem for Stationary Currents

Introduction
 Integral magnetic scalar potential
 Differential magnetic scalar potential
 The vector potential and a multipole expansion
 External field of dipolar magnetic matter

Chapter 9 Magnetic Materials and Boundary-Value Problems

Introduction
 An average internal field
 A postulate relating mean magnetization and the applied field
 Theory of permeable matter in an applied field
 The vector *H*
 A boundary value problem

Chapter 10 Force and Energy in Static Fields

Energy of assemblage of charge distribution
 Energy of formation of current distribution
 Rigid charge distribution in applied electric field
 Rigid current distribution in applied magnetic field
 Force on conductors
 Dielectric matter in applied electric field
 Permeable matter in applied magnetic field

Chapter 11 Time-Varying Fields

Introduction
 Faraday's law of induction
 Energy of stationary currents and permeable matter
 Displacement current and the Maxwell equations
 The Lorentz force density
 Auxiliary potential and gauge transformations
 Integral form of the potentials
 Electromagnetic waves
 Conservation laws

Chapter 12 Electrodynamics and Relativity

Newton's second law and inertial frames
 Galilean relativity and absolute time
 The Lorentz transformation
 Point events
 The invariant interval

Proper time
Kinematic consequences of the Lorentz transformation
Invariants, four-vectors, tensors
Covariance of the Maxwell equations
Transformation of electromagnetic quantities
Relativistic mechanics

Chapter 13 The Summation Problem for Time-Harmonic Currents

The equations of harmonic variation
Outline of approximations
Quasi-stationary approximation
Multipole approximation
Radiation zone approximation
Two-dimensional distributions
Systematic multipole expansion

Chapter 14 Point Currents

Introduction
Lienard-Wiechert potentials
Fields of a moving charge
Uniform motion
Approximate evaluation of the fields
Frequency-angle distribution of the radiated energy
Linear acceleration
Uniform circular motion
Point particles and radiation reaction

Chapter 15 Perfect Conductors and Time-Harmonic Fields

Introduction
Boundary conditions

Plane reflectors
Rectangular wave guides
Circular and other wave guides
Resonant cavities
Scattering from a circular cylinder
Use of integral equations for scattering from an arbitrary cylinder
Diffraction by a half-plane
Diffraction by an aperture

Chapter 16 Time-Harmonic Fields in Matter

Introduction
Propagation constant of a current-bearing medium
The currents in matter
Heuristic theory of propagation in matter
One-dimensional dielectric models
Three-dimensional dielectric models

Chapter 17 Propagation in Imperfect Conductors and Dielectrics

Waves in dispersive media
Attenuation in imperfect conductors
Reflection and refraction at a dielectric interface
Surface waves in dielectrics

Appendix A Conversion Table for Gaussian \leftrightarrow MKS units

Appendix B Delta Functions

Appendix C Notes on Vectors and Dyadics

Appendix D Solution of Laplace and Helmholtz Equations by Separation of Variables
